

UACE ORGANIC CHEMISTRY REVISION NOTES

Organic Reaction Types + Preparation of Alkanes

A structured revision guide covering the major organic reactions, how to recognize them, key examples, reagents and conditions, and the main UACE-level methods of preparing alkanes.

PART I — TYPES OF ORGANIC REACTIONS

Reaction	What happens?	Typical example
Substitution	One atom/group is replaced by another.	$\text{CH}_4 + \text{Cl}_2 \rightarrow \text{CH}_3\text{Cl} + \text{HCl}$
Addition	Atoms/groups add across a $\text{C}=\text{C}$ or $\text{C}\equiv\text{C}$ bond.	$\text{CH}_2=\text{CH}_2 + \text{H}_2 \rightarrow \text{CH}_3\text{CH}_3$
Elimination	Atoms/groups are removed, usually forming a multiple bond.	$\text{CH}_3\text{CH}_2\text{OH} \rightarrow \text{CH}_2=\text{CH}_2 + \text{H}_2\text{O}$
Oxidation	Usually gain of O or loss of H.	$\text{CH}_3\text{CH}_2\text{OH} \rightarrow \text{CH}_3\text{CHO}$
Reduction	Usually gain of H or loss of O.	$\text{CH}_2=\text{CH}_2 + \text{H}_2 \rightarrow \text{CH}_3\text{CH}_3$
Condensation	Two molecules join while a small molecule is removed.	Acid + alcohol $\rightarrow$ ester + H_2O
Hydrolysis	A molecule is split using water.	Ester + $\text{H}_2\text{O} \rightarrow$ acid + alcohol
Polymerisation	Many monomers join to form a polymer.	$n(\text{CH}_2=\text{CH}_2) \rightarrow [-\text{CH}_2-\text{CH}_2-]_n$

1. SUBSTITUTION REACTIONS

Substitution means replacement. One atom or group in an organic molecule is replaced by another.

- $\text{CH}_4 + \text{Cl}_2 \rightarrow \text{CH}_3\text{Cl} + \text{HCl}$
- Conditions: ultraviolet light (UV).
- Alkanes commonly undergo substitution with halogens.
- Exam clue: alkane + Cl_2/Br_2 + UV $\rightarrow$ substitution.

2. ADDITION REACTIONS

Addition means adding atoms/groups to an unsaturated molecule, usually across a $\text{C}=\text{C}$ or $\text{C}\equiv\text{C}$ bond.

- $\text{CH}_2=\text{CH}_2 + \text{H}_2 \rightarrow \text{CH}_3\text{CH}_3$ (Ni catalyst)
- $\text{CH}_2=\text{CH}_2 + \text{Br}_2 \rightarrow \text{CH}_2\text{Br}-\text{CH}_2\text{Br}$
- $\text{CH}_2=\text{CH}_2 + \text{H}_2\text{O} \rightarrow \text{CH}_3\text{CH}_2\text{OH}$ (acid catalyst such as H_3PO_4)
- $\text{CH}_2=\text{CH}_2 + \text{HBr} \rightarrow \text{CH}_3\text{CH}_2\text{Br}$
- Key idea: a double bond becomes a single bond as new atoms/groups are added.

3. ELIMINATION REACTIONS

Elimination is removal of atoms/groups from a molecule, often producing a $\text{C}=\text{C}$ double bond.

- $\text{CH}_3\text{CH}_2\text{OH} \rightarrow \text{CH}_2=\text{CH}_2 + \text{H}_2\text{O}$
- A common method uses concentrated H_2SO_4 and heat.
- $\text{CH}_3\text{CH}_2\text{Br} \rightarrow \text{CH}_2=\text{CH}_2 + \text{HBr}$
- Key idea: a single bond becomes a double bond because a small molecule is removed.

4. OXIDATION

In organic chemistry, oxidation commonly involves gaining oxygen or losing hydrogen.

- Primary alcohol $\rightarrow$ aldehyde $\rightarrow$ carboxylic acid.
- $\text{CH}_3\text{CH}_2\text{OH} \rightarrow \text{CH}_3\text{CHO} \rightarrow \text{CH}_3\text{COOH}$
- Secondary alcohol $\rightarrow$ ketone: $\text{CH}_3\text{CHOHCH}_3 \rightarrow \text{CH}_3\text{COCH}_3$

- Tertiary alcohols resist oxidation under ordinary mild conditions.
- Acidified $\text{K}_2\text{Cr}_2\text{O}_7$: orange $\rightarrow$ green.
- Acidified KMnO_4 : purple $\rightarrow$ colourless.

5. REDUCTION

Reduction commonly involves gaining hydrogen or losing oxygen.

- $\text{CH}_2=\text{CH}_2 + \text{H}_2 \rightarrow \text{CH}_3\text{CH}_3$
- $\text{CH}_3\text{CHO} + 2[\text{H}] \rightarrow \text{CH}_3\text{CH}_2\text{OH}$
- $\text{CH}_3\text{COCH}_3 + 2[\text{H}] \rightarrow \text{CH}_3\text{CHOHCH}_3$
- Memory aid: OIL RIG — Oxidation Is Loss, Reduction Is Gain (of electrons).

6. CONDENSATION REACTIONS

Two molecules combine to form a larger molecule while a small molecule, commonly water, is removed.

- Carboxylic acid + alcohol $\rightarrow$ ester + water
- $\text{CH}_3\text{COOH} + \text{CH}_3\text{CH}_2\text{OH} \rightarrow \text{CH}_3\text{COOCH}_2\text{CH}_3 + \text{H}_2\text{O}$
- Conditions commonly include concentrated H_2SO_4 and heat.
- The reaction above is esterification.

7. HYDROLYSIS

Hydrolysis means breaking a molecule using water.

- $\text{CH}_3\text{COOCH}_2\text{CH}_3 + \text{H}_2\text{O} \rightarrow \text{CH}_3\text{COOH} + \text{CH}_3\text{CH}_2\text{OH}$
- An ester can therefore be hydrolysed to a carboxylic acid and an alcohol.
- Alkaline hydrolysis: ester + $\text{NaOH} \rightarrow$ carboxylate salt + alcohol.
- Alkaline ester hydrolysis is commonly called saponification in soap-making contexts.

8. POLYMERISATION

Polymerisation is the joining of many small molecules (monomers) to form a large molecule (polymer).

- Addition polymerisation: $n(\text{CH}_2=\text{CH}_2) \rightarrow [-\text{CH}_2-\text{CH}_2-]_n$
- Ethene $\rightarrow$ polyethene.
- Propene $\rightarrow$ polypropene.
- Condensation polymerisation involves functional groups reacting with loss of a small molecule such as water or HCl .

9. COMBUSTION

Combustion is reaction with oxygen, releasing energy.

- Complete combustion of a hydrocarbon gives CO_2 and H_2O .
- $\text{CH}_4 + 2\text{O}_2 \rightarrow \text{CO}_2 + 2\text{H}_2\text{O}$
- $\text{C}_2\text{H}_5\text{OH} + 3\text{O}_2 \rightarrow 2\text{CO}_2 + 3\text{H}_2\text{O}$
- Incomplete combustion can produce CO and/or carbon when oxygen is insufficient.

10. CRACKING

Cracking breaks large hydrocarbon molecules into smaller, more useful molecules.

- $\text{C}_{10}\text{H}_{22} \rightarrow \text{C}_4\text{H}_{10} + \text{C}_6\text{H}_{12}$
- Products can include an alkane and an alkene.
- Cracking may be thermal or catalytic; catalytic cracking commonly uses zeolite-type catalysts.

11. FERMENTATION

Fermentation converts glucose to ethanol and carbon dioxide using yeast under anaerobic conditions.

- Important conditions: yeast, warm temperature, and limited/absence of oxygen.

12. NEUTRALISATION

Organic acids can undergo ordinary acid–base neutralisation.

- Ethanoic acid + sodium hydroxide → sodium ethanoate + water.

FAST RECOGNITION RULES

What you notice	Reaction
C=C becomes C–C and something is added	Addition
C–C becomes C=C and something is removed	Elimination
One atom/group is swapped for another	Substitution
More O / fewer H	Oxidation
More H / fewer O	Reduction
Two molecules join + small molecule leaves	Condensation
Water is used to split a molecule	Hydrolysis
Many monomers join	Polymerisation

PART II — PREPARATION OF ALKANES

Alkanes are saturated hydrocarbons with general formula C_nH_{2n+2} . The main UACE preparation methods are summarized below.

1. HYDROGENATION OF ALKENES

- General: $\text{Alkene} + H_2 \rightarrow \text{Alkane}$.
- Example: $CH_2=CH_2 + H_2 \xrightarrow{Ni} CH_3CH_3$.
- Typical conditions: hydrogen gas, nickel catalyst, heat.
- Hydrogen adds across the C=C bond. This is also called catalytic hydrogenation.

2. REDUCTION OF HALOALKANES

- General: $R-X + 2[H] \rightarrow R-H + HX$.
- Example: $CH_3CH_2Br + 2[H] \rightarrow CH_3CH_3 + HBr$.
- Thus a haloalkane can be converted into the corresponding alkane by reduction.

3. WURTZ REACTION

- General: $2R-X + 2Na \rightarrow R-R + 2NaX$.
- Conditions: sodium metal in dry ether.
- Example: $2CH_3Cl + 2Na \rightarrow CH_3CH_3 + 2NaCl$.
- Example: $2CH_3CH_2Cl + 2Na \rightarrow CH_3CH_2CH_2CH_3 + 2NaCl$.
- Best suited to preparing symmetrical alkanes. Using two different haloalkanes can give mixtures.

4. DECARBOXYLATION WITH SODA LIME

- General: $RCOONa + NaOH \xrightarrow{CaO, \text{heat}} RH + Na_2CO_3$.
- Soda lime is a mixture based mainly on NaOH and CaO.
- Example: $CH_3COONa + NaOH \xrightarrow{\text{soda lime, heat}} CH_4 + Na_2CO_3$.
- Key rule: the alkane has one fewer carbon atom than the original carboxylate salt.

5. KOLBE ELECTROLYSIS

- Carboxylate ions are electrolysed and the alkyl radicals combine.
- Example: $CH_3COO^- \rightarrow CH_3\cdot + CO_3^{2-}$; then $CH_3\cdot + CH_3\cdot \rightarrow CH_3CH_3$.
- Therefore sodium/potassium ethanoate can give ethane by Kolbe electrolysis.
- Important: Kolbe electrolysis joins two identical alkyl groups, whereas soda-lime decarboxylation gives the alkane with one fewer carbon.

6. REDUCTION OF ALDEHYDES AND KETONES

- Aldehydes and ketones can be reduced strongly to hydrocarbons.
- Aldehyde: $RCHO \rightarrow RCH_3$.
- Ketone: $RCOR' \rightarrow RCH_2R'$.
- Named methods include Clemmensen reduction ($Zn(Hg)/HCl$) and Wolff–Kishner reduction (NH_2NH_2/KOH , heat).

7. CRACKING OF LARGER HYDROCARBONS

- Large hydrocarbons can be cracked into smaller hydrocarbons.
- Example: $C_{10}H_{22} \rightarrow C_8H_{18} + C_2H_4$.
- Because one product can be an alkane, cracking can provide smaller alkanes as well as alkenes.

- Cracking may be thermal or catalytic.

THE THREE IMPORTANT COMPARISONS

Method	Starting material	What happens
Soda-lime decarboxylation	Sodium carboxylate	Gives alkane with one fewer carbon
Wurtz reaction	Haloalkane	Two alkyl groups join using Na
Kolbe electrolysis	Carboxylate salt	Two alkyl radicals join

EXAM-STYLE RECOGNITION

- Prepare ethane from ethene: use hydrogenation, $\text{CH}_2=\text{CH}_2 + \text{H}_2 \xrightarrow{\text{Ni}} \text{CH}_3\text{CH}_3$.
- Prepare methane from sodium ethanoate: use soda-lime decarboxylation, $\text{CH}_3\text{COONa} + \text{NaOH} \rightarrow \text{CH}_4 + \text{Na}_2\text{CO}_3$.
- Prepare butane from chloroethane: use Wurtz reaction, $2\text{CH}_3\text{CH}_2\text{Cl} + 2\text{Na} \rightarrow \text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_3 + 2\text{NaCl}$.
- Prepare ethane from sodium ethanoate by electrolysis: use Kolbe electrolysis; methyl radicals combine to form ethane.

MASTER MEMORY MAP

ALKANE — substitution → **HALOALKANE** — elimination → **ALKENE** — addition → **ALKANE**

ALKENE — addition of H_2O → **ALCOHOL** — oxidation → **ALDEHYDE** — oxidation → **CARBOXYLIC ACID**

SECONDARY ALCOHOL — oxidation → **KETONE**

CARBOXYLIC ACID + ALCOHOL → **ESTER + WATER**

FINAL UACE REVISION CHECKLIST

- Know the definition and recognition clue for substitution, addition, elimination, oxidation, reduction, condensation, hydrolysis and polymerisation.
- Know the oxidation pathway: primary alcohol → aldehyde → carboxylic acid.
- Know: secondary alcohol → ketone.
- Know the reagents/conditions for alkene addition and alcohol oxidation/dehydration.
- Know hydrogenation, Wurtz reaction, soda-lime decarboxylation and Kolbe electrolysis for alkane preparation.
- Practice predicting products rather than only memorising names.
- Always check the number of carbon atoms when preparing an alkane.
